NEVADA STATE HEALTH DIVISION NEWS RELEASE

Nevada State Health Division West Nile Virus Update

Carson City – The Nevada State Health Division is reporting two new human cases associated with West Nile Virus (WNV). One individual is a Churchill County resident, over the age of 50, experiencing West Nile fever. The other individual is a Lyon County resident, over the age of 50, also experiencing West Nile fever.

This brings the total number of human cases associated with West Nile Virus in Nevada to 18. Human case counts by county are:

- Lyon, 4
- Lincoln, 1
- Humboldt, 3
- Douglas, 1
- Churchill, 4
- Nye, 1
- Washoe County, 1
- Clark County, 3

“While temperatures are beginning to decrease, we need to remember that mosquitoes remain active in every county in our state – that means that West Nile Virus is still a threat to our health,” said Dr. Bradford Lee, Nevada State Health Officer. “We still need to remain vigilant in practicing the preventive measures to reduce the chance of being bitten by mosquitoes. Remember to use mosquito repellent containing either DEET, Picaridin or Oil of Lemon Eucalyptus, preferably in that order, wear long sleeve shirts, pants and socks, be aware that mosquitoes are most active during dusk and dawn, remove standing water from around your house and check to make sure the screens on your windows and doors fit properly.”

Historically, during the second year a state experiences West Nile Virus, the incidence of human infection tends to increase. “Mosquito season is far from over,” Dr. Lee said. “While serious symptoms of WNV infection are more common in people 50 years and over, we have seen that several individuals under the age of 50 have developed the severe form of the disease. Prevention is the key to decrease your chance of being infected with West Nile Virus.”

NEVADA STATE IS AN EQUAL OPPORTUNITY EMPLOYER

West Nile Virus most often is spread by the bite of an infected mosquito. Mosquitoes are WNV carriers that become infected when they feed on infected birds. Infected mosquitoes can then spread WNV to humans and other animals when they bite. West Nile Virus is **NOT** spread through casual contact such as touching or kissing a person with the virus.

According to the Centers for Disease Control and Prevention (CDC), most people infected with WNV will not have any type of illness or symptoms. It is estimated that 20 percent of the people who become infected will develop West Nile fever. Symptoms include fever, headache, tiredness and body aches.

Approximately one in 150 persons (less than one percent) infected with WNV will develop a more severe form of the disease, West Nile encephalitis or meningitis. Symptoms of the more severe disease include severe headache, high fever, neck stiffness, stupor, disorientation, coma, tremors, convulsions, muscle weakness and paralysis.

While there is no specific treatment for WNV infection, people who have been exposed to mosquitoes and experience symptoms of the more severe illness are encouraged to contact their health care provider immediately.
