Data for the graphs and tables on the following pages are provisional and may be updated as additional information becomes available.

**Purpose**

The purpose of this report is to provide an overview of and statistics for the influenza season in Nevada for the local public health authorities, sentinel providers and the public.

**Influenza-Like Illness Network Surveillance (ILINet)**

Respiratory specimens are tested for influenza by the World Health Organization (WHO) and National Respiratory and Enteric Virus Surveillance System (NRVESS) collaborating laboratories by sub-type. During week 11, there were 16,138 specimens collected and tested for influenza, of those 1,982 were positive (12.3%).

**Figure 1**

![National Influenza Positive Tests by Week](image1)

The Nevada total includes laboratory tests for all Nevada residents including out of state laboratories. During week 11, there were 6 specimens collected and tested for influenza of which 1 were positive (16.7%).

**Figure 2**

![Nevada (ILI Providers) Influenza Laboratory Confirmed Positive by Week](image2)

Source of Data: CDC: ILINet.
Nevada State Public Health Laboratory (NSPHL) has tested 388 specimens for influenza from sentinel providers, of which 270 have been positive (69.6%). Southern Nevada Public Health Laboratory (SNPHL) has test 424 specimens this season of which 104 were positive. Nationally, there have been 577,156 specimens sent to the WHO and NERVSS laboratories of which 117,093 were positive or 20.3%. The national numbers in Table 1 are reflected in Figure 1. The state of Nevada data in Table 1 is reflected in Figure 2. The Nevada total includes laboratory test for all Nevada residents including out of state laboratories.

Source of Data: CDC: FluView Report and CDC: ILINet.

Influenza-like Illness (ILI) Surveillance Network has each sentinel providers report the number of patients that meet the ILI case definition and number of patients that visit the provider weekly. The “percentage of visits” is the number of ILI patients divided by the total number of patients visit per week. Nevada’s ILI percentage of visits to providers for week 11 is 1.3% and is below the state baseline 1.4%. Region 9 ILI percentage for week 11 is 2.6% and is below the region baseline of 2.7%. Region 9 includes the following states/territory: Arizona, California, Guam, Hawaii, and Nevada. The national ILI percentage for week 11 is 2.2% and is above the national baseline 2.0, for the 18th consecutive week.

Figure 3

During week 11, 1.3% of visits to sentinel providers were due to ILI; this is higher than the 2013-2014 influenza season (0.3%). There were 17,610 patients seen by ILI providers during week 11, of which 235 patients presented with ILI; week 11 of 2014, there were 184 patients seen with ILI. There was no week 53 in the previous influenza season displayed below; therefore the week 53 data point for those seasons is an average of week 52 and 1.

Page 2 of 5
Influenza-like Illness is reported by age groups, during week 11, patients age 0-4 were the greatest number of patients seen with ILI, at 99 patients seen. The rate for week 11 is 8.2 per 100,000. The rate is calculated by the number of patients presented with ILI, divided by the state population, multiplied by 100,000. The estimated state population for 2015 is 2,855,061.

Pneumonia and Influenza (P&I) Mortality Surveillance

The Pneumonia and Influenza (P&I) mortality percentage is the deaths, where Pneumonia or Influenza is listed as the underlying or contributing cause of death, divided by the total deaths in Nevada for each week. As of April 9, there were 36 P&I deaths and 479 total deaths for week 11. The P&I mortality percent is above the threshold at 7.5% (threshold 7.2%). Nationally, the P&I mortality is above the national epidemic threshold at 7.4% for week 11.

Figure 7

Source: Reported to Office of Public Health Informatics and Epidemiology from each Jurisdiction.
**Technical Notes**

- Influenza-like illness (ILI): a fever greater than or equal 100°F with cough and/or sore throat
- Percent positive: The number of positive influenza laboratory tests divided by the total number of tests performed.
- Incidence rate is per 100,000 population as estimated by the state demographer.

This report contains information from national and state-level data sources. Influenza surveillance data is collected by a various systems, including:

- Influenza-like Illness Network (ILINet): a sentinel surveillance system in collaboration with the Centers for the Disease Control and Prevention (CDC) where outpatient providers report ILI information weekly.
- National Electronic Telecommunication System for Surveillance (NETSS): a system whereby data is transmitted to CDC. Influenza data collected through NETSS does not provide influenza sub-typing information.
- National Electronic Disease Surveillance System (NEDSS): a system for collecting data and monitoring disease trends and outbreaks.
- NEDSS Based System (NBS): an implementation of the NEDSS standards. It provides a secure, accurate, and efficient means of collecting, transmitting, and analyzing public health data.
