March 2014
Edition 1.0
Data for the graphs and tables on the following pages are provisional and may be updated as additional information becomes available.

**Purpose**

The purpose of this report is to provide an overview of and statistics for the influenza season in Nevada for the local public health authorities, sentinel providers and the public.

**Influenza-Like Illness Network Surveillance (ILINet)**

Respiratory specimens tested for influenza by the World Health Organization (WHO) and National Respiratory and Enteric Virus Surveillance System (NRVESS) collaborating laboratories by sub-type. There were 6,748 specimens collected nationally during week 9 that were tested for influenza; of these 587 tested positive or the percent positive was 8.7%.

**Figure 1**

![Graph of National Influenza Positive Tests by Week](source: CDC: FluView Weekly Report)

Of the 32 specimens tested for influenza at both the Nevada State Public Health Laboratory and Southern Nevada Public Health Laboratory for sentinel providers, 5 were positive for influenza during week 9 or 15.6%.

**Figure 2**

![Graph of Nevada (ILI Providers) Influenza Laboratory Confirmed Positive by Week](source: CDC: ILINet)
Nevada State Public Health Laboratory (NSPHL) has tested 733 specimens this season with 313 positive from sentinel providers (42.7% positive). Southern Nevada Public Health Laboratory (SNPHL) has reported 48 positive influenza specimens through the Pediatric Early Warning Sentinel Surveillance (PEWSS). Nationally, there have been 222,930 specimens sent to the WHO and NERVSS laboratories with 42,031 positive or 18.9%. The national numbers in table 1 are reflected in figure 1. The state of Nevada data in table 1 is reflected in figure 2.

Source of Data: CDC: FluView Report and CDC: ILINet.

For week 9, Nevada reported local activity to the CDC, along with District of Columbia, and 26 states/territories (Alabama, Alaska, California, Delaware, Florida, Guam, Idaho, Iowa, Kansas, Kentucky, Louisiana, Michigan, Minnesota, Montana, Nebraska, New Mexico, North Carolina, North Dakota, Oregon, Rhode Island, South Dakota, Tennessee, Washington, West Virginia, Wisconsin, and Wyoming). Activity level¹ is derived from data analyzed from Influenza-like Illness (ILI) surveillance (laboratory and sentinel data), and data reported to the state through NBS/NETSS.

Figure 3

*This map indicates geographic spread & does not measure the severity of influenza activity

Influenza-like Illness (ILI) Network Surveillance has each sentinel providers report the number of patients that meet the ILI case definition² and number of patients that visit the provider weekly, which decreased from 17,068 (week 8) to 17,016 (week 9). The “percentage of visits” is the number of ILI patients divided by the total number of patient visit per week. Nevada’s ILI percentage of visits to providers increased to 1.1% from 1.0% during week 9, and is below the state baseline of 2.3%. Region 9 decreased in ILI to 3.3% from 2.9%, and includes the following states/territories: Arizona, California, Guam, Hawaii, and Nevada. The nation decreased to 2.0% from 2.3% during week 9.

¹: Activity level: Appendix Table 4.
²: ILI case definition: Technical Notes.

Page 2 of 8
During week 9, 1.1% of visits to sentinel providers were due to ILI. This is a 2.1% point decrease from week 9 of the 2012-2013 influenza season.

The number of ILI patients and rate increased from week 8 to week 9, from 176 to 192, and 6.2 to 6.8 per 100,000 population. The rate is calculated by the number of patients presented with ILI divided by the state population multiplied by 100,000. The estimated state population for 2014 is 2,819,321.

Source of Data: CDC: Flu View Report and CDC: ILINet.
Providers for the sentinel surveillance are grouped by county, then the percent is calculated by ILI visits and total patient visits. During week 9, Elko and Eureka County had high activity; Humboldt and Lincoln counties did not report (Figure 7). Overall, Nevada had minimal activity monitored through ILINet (Figure 8).

Influenza Positive Surveillance (NBS and NETSS)

Positive cases of influenza are reported to the state health division for surveillance purposes. Figure 10 and 11 reflect all positive influenza cases reported to the state. Types of influenza testing include commercial rapid diagnostic test (rapid), viral culture, fluorescent antibody, enzyme immunoassay, RT-PCR (PCR), and Immunohistochemistry. The two most common test types in Nevada are Rapid and PCR tests. During week 9, there were 5 H1N1 cases and 40 Influenza A cases. There were 20 positive Influenza B cases. Overall, there were 66 influenza positive tests in Nevada, whereas during the previous season for week 9, there were 167 cases.

Clark County experienced a decrease in influenza from 59 to 47 influenza cases during week 9. Washoe County experienced a decrease in influenza for week 9, from 4 to 8 influenza cases. Carson City, Douglas, Elko, and Lyon counties all had influenza activity during week 9.
Hospitalizations

There have been 359 hospitalizations associated with influenza this season.

Pneumonia and Influenza (P&I) Mortality Surveillance

The Pneumonia and Influenza (P&I) mortality percentage is the deaths, where Pneumonia and Influenza is listed as a cause of death, divided by the total deaths in Nevada for each week. There were 22 P&I deaths and 247 total deaths for week 9, as of March 10. The P&I mortality percentage is above the national epidemic threshold at 8.9%, (threshold at 7.4%). Nationally, the P&I mortality is above the national epidemic threshold at 7.9%.

</tr>
</tbody>
</table>

*ILI activity can be assessed using a variety of data sources including ILINet providers, school/workplace absenteeism and other syndromic surveillance systems that monitor influenza-like illness.
† Lab confirmed case = case confirmed by rapid diagnostic test, antigen detection, culture, or PCR.
‡ Institution includes nursing home, hospital, prison, school, etc.
**Region: population under surveillance in a defined geographical subdivision of a state. Nevada has 5 regions.

Technical Notes

- Influenza-like illness (ILI): a fever greater than or equal 100°F with cough and/or sore throat
- Percent positive: The number of positive influenza laboratory tests divided by the total number of tests performed.
- Incidence rate is per 100,000 population as estimated by the state demographer.

This report contains information from national and state-level data sources. Influenza surveillance data is collected by a various systems, including:

- Influenza-like Illness Network (ILINet): a sentinel surveillance system in collaboration with the Centers for the Disease Control and Prevention (CDC) where outpatient providers report ILI information weekly.
- National Electronic Telecommunication System for Surveillance (NETSS): a system whereby data is transmits to CDC. Influenza data collected through NETSS does not provide influenza sub-typing information.
- National Electronic Disease Surveillance System (NEDSS): a system for collecting data and monitoring disease trends and outbreaks.
- NEDDS Based System (NBS): an implementation of the NEDSS standards. It provides a secure, accurate, and efficient means of collecting, transmitting, and analyzing public health data.
