Data for the graphs and tables on the following pages are provisional and may be updated as additional information becomes available.

**Purpose**

The purpose of this report is to provide an overview of and statistics for the influenza season in Nevada for the local public health authorities, sentinel providers and the public.

**Influenza-Like Illness Network Surveillance (ILINet)**

Respiratory specimens tested for influenza by the World Health Organization (WHO) and National Respiratory and Enteric Virus Surveillance System (NRVESS) collaborating laboratories by sub-type. There were 5,650 specimens collected nationally during week 11 that were tested for influenza; of these 495 tested positive or the percent positive was 8.8%.

**Figure 1**

![National Influenza Positive Tests by Week](image)

Of the 23 specimens tested for influenza at both the Nevada State Public Health Laboratory and Southern Nevada Public Health Laboratory for sentinel providers, 6 tested positive for influenza during week 11 or 26.1%.

**Figure 2**

![Nevada (ILI Providers) Influenza Laboratory Confirmed Positive by Week](image)

*Source of Data: CDC: ILINet.*
Nevada State Public Health Laboratory (NSPHL) has tested 761 specimens this season with 315 positive from sentinel providers (41.4% positive). Southern Nevada Public Health Laboratory (SNPHL) has reported 54 positive influenza specimens through the Pediatric Early Warning Sentinel Surveillance (PEWSS). Nationally, there have been 241,013 specimens sent to the WHO and NERVSS laboratories with 44,360 positive or 18.4%. The national numbers in Table 1 are reflected in Figure 1. The state of Nevada data in Table 1 is reflected in Figure 2.

Influenza B:

- 3, 11, 6, 100, 14, 3.8, 154, 31.1, 2,419, 5.5

Source of Data: CDC: FluView Report and CDC: ILINet.

For week 11, Nevada reported sporadic activity to the CDC, along with 19 states/territories (Alabama, Alaska, Colorado, Georgia, Guam, Hawaii, Idaho, Indiana, Kansas, Kentucky, Mississippi, North Dakota, Oregon, Puerto Rico, South Dakota, Washington, West Virginia, Wisconsin, and Wyoming). Activity level¹ is derived from data analyzed from Influenza-like Illness (ILI) surveillance (laboratory and sentinel data), and data reported to the state through NBS/NETSS.

Figure 3

Influenza-like Illness (ILI) Network Surveillance has each sentinel providers report the number of patients that meet the ILI case definition² and number of patients that visit the provider weekly, which decreased from 16,918 (week 10) to 9,062 (week 11). The “percentage of visits” is the number of ILI patients divided by the total number of patient visit per week. Nevada’s ILI percentage of visits to providers increased to 1.3% from 0.8% during week 11, and is below the state baseline of 2.3%. Region 9 decreased in ILI to 1.3% from 2.6%, and includes the following states/territories: Arizona, California, Guam, Hawaii, and Nevada. The nation decreased to 1.7% from 2.0% during week 11 and below the national baseline.

1: Activity level: Appendix Table 4.
During week 11, 1.3% of visits to sentinel providers were due to ILI. This is a 1.4% point decrease from week 11 of the 2012-2013 influenza season, an influenza season is from week 40 through week 39.

The number of ILI patients and rate decreased from week 10 to week 11, from 132 to 118, and 4.7 to 4.2 per 100,000 population. The rate is calculated by the number of patients presented with ILI divided by the state population multiplied by 100,000. The estimated state population for 2014 is 2,819,321.
Providers for the sentinel surveillance are grouped by county, then the percent is calculated by ILI visits and total patient visits. During week 11, Douglas and Eureka County had high activity; Humboldt, Lincoln, Lyon, and White Pine counties did not report (Figure 7). Overall, Nevada had minimal activity monitored through ILINet (Figure 8).

Influenza Positive Surveillance (NBS and NETSS)

Positive cases of influenza are reported to the state health division for surveillance purposes. Figure 10 and 11 as well as Table 2 reflect all positive influenza cases reported to the state. Types of influenza testing include commercial rapid diagnostic test (rapid), viral culture, fluorescent antibody, enzyme immunoassay, RT-PCR (PCR), and Immunohistochemistry. The two most common test types in Nevada are Rapid and PCR tests. During week 11, there were 1 H1N1 cases and 25 Influenza A cases. There were 28 positive Influenza B cases. Overall, there were 60 influenza positive tests in Nevada, whereas during the previous season for week 11, there were 143 cases.

Clark County experienced an increase in influenza to 46 from 45 influenza cases during week 11. Washoe County experienced a decreased for week 11, to 7 from 8 influenza cases. Carson City, Douglas, and Lyon Counties had influenza activity during the week.
Hospitalizations

There have been 376 hospitalizations associated with influenza this season (week 40 2013 through week 11).

Pneumonia and Influenza (P&I) Mortality Surveillance

The Pneumonia and Influenza (P&I) mortality percentage is the deaths, where Pneumonia and Influenza is listed as a cause of death, divided by the total deaths in Nevada for each week. There were 17 P&I deaths and 263 total deaths for week 11, as of March 24. The P&I mortality percentage is below the national epidemic threshold at 6.5%, (threshold at 7.4%). Nationally, the P&I mortality is below the national epidemic threshold at 7.1%.

</tr>
</tbody>
</table>

*LII activity can be assessed using a variety of data sources including ILINet providers, school/workplace absenteeism and other syndromic surveillance systems that monitor influenza-like illness.  
† Lab confirmed case = case confirmed by rapid diagnostic test, antigen detection, culture, or PCR.  
‡ Institution includes nursing home, hospital, prison, school, etc.  
**Region: population under surveillance in a defined geographical subdivision of a state. Nevada has 5 regions.

### Technical Notes

- **Influenza-like illness (ILI):** a fever greater than or equal 100°F with cough and/or sore throat.  
- **Percent positive:** The number of positive influenza laboratory tests divided by the total number of tests performed.  
- **Incidence rate:** is per 100,000 population as estimated by the state demographer.

This report contains information from national and state-level data sources. Influenza surveillance data is collected by a various systems, including:

- **Influenza-like Illness Network (ILINet):** a sentinel surveillance system in collaboration with the Centers for the Disease Control and Prevention (CDC) where outpatient providers report ILI information weekly.  
- **National Electronic Telecommunication System for Surveillance (NETSS):** a system whereby data is transmitted to CDC. Influenza data collected through NETSS does not provide influenza sub-typing information.  
- **National Electronic Disease Surveillance System (NEDSS):** a system for collecting data and monitoring disease trends and outbreaks.  
- **NEDDS Based System (NBS):** an implementation of the NEDSS standards. It provides a secure, accurate, and efficient means of collecting, transmitting, and analyzing public health data.
