FOREWORD

Personal Health Choices is a joint publication of the Department of Human Resources, Nevada State Health Division, Bureau of Health Planning and Statistics' Center for Health Data and Research and the University of Nevada - Las Vegas (University), Center for Health Information Analysis (Center). The report presents inpatient hospital discharge data for 39 of the most common medical and surgical diagnoses by DRG (Diagnosis-Related Group) as reported by 25 of Nevada's acute care hospitals which were discharging patients during the period 2000 to 2004.

These data are available through the standard Uniform Billing (UB-92) form, which is utilized by hospitals to bill for their hospital charges. These data include patients who spent at least 24 hours as an inpatient, but do not include patients who were treated and released from the emergency room. It includes information about patients discharged from non-federal acute care hospitals in Nevada. These data identify billed charges not the actual payments received by the hospital.

The data were compiled by the Center using information from inpatient hospital billing records for patients discharged January 1, 2000 through December 31, 2004, inclusive. This information was gathered, computerized, and analyzed by the Center as part of a contractual agreement between the Department of Human Resources and the University under the authority granted in Section 439B of the Nevada Revised Statutes.

Personal Health Choices has been published annually since 1988 except for the 1991 and 1992 editions which were published concurrently in February 1994. This edition of Personal Health Choices presents 2000 through 2004 inpatient hospital discharge data for each DRG by age, sex, region (counties), and for each acute-care hospital covering discharge totals, average length of hospital stay, and average billed charges.

INTRODUCTION

This seventeenth edition of Personal Health Choices compares 25 of Nevada's acute care hospitals with respect to 39 of the most common medical diagnoses and surgical procedures, defined by Diagnosis Related Groups (DRG's: see below). In addition to the primary DRG's used in this publication, information is provided on an additional 46 DRG's related to the core 39.

THE DIAGNOSIS RELATED GROUP (DRG) SYSTEM

Diagnosis Related Group (DRG), is a classification system that is based on principal and secondary disease diagnoses, medical and surgical procedures, complications, comorbidities (coexisting conditions), signs and symptoms, age and discharge status. The DRG system is complex in its construction, and is based upon documentation in the patient's medical record. DRGs enable hospitals to recover the appropriate reimbursement for services rendered, evaluate the quality of care and assist in evaluating utilization of services. The DRG system's current 543 groups classify patients with similar utilization of hospital resources and length of stay patterns. Each DRG represents the average resources needed to treat patients grouped to that DRG compared to the national average of resources to treat all Medicare patients. Hospitals are reimbursed at a flat rate based on the theory that patients with similar illnesses undergoing similar procedures will require similar care. The primary outcome of the DRG system is that the more efficiently a hospital delivers care, the greater its operating margin will be.

INFORMATION LEVEL

Personal Health Choices is intended as a source of information regarding the billed charges of acute care hospitals in Nevada, and should not be construed as a definitive guide for selecting a hospital in order to receive inpatient medical care. The financial information in this report is based on billed charges rather than the amount actually collected on discharged patients per DRG. Billed charges and collected charges can differ significantly. This report should broaden the reader's knowledge about one component of healthcare pricing -- inpatient hospitalization -- which currently accounts for 30 to 35% of total healthcare expenditures. Hospital outpatient services as well as professional physician and other non-hospital inpatient ancillary healthcare services are not covered in this report.

FACTORS TO CONSIDER IN REVIEWING THIS REPORT

The information provided in this report is formatted so as to present narrative and tabular data on the first page and detailed tabular data on the second. This report covers the calendar year period 2000 through 2004, thus providing a five-year trend line for DRG-related data. DRGs are sometimes broken down by age factors and/or presence of comorbidity. Comorbidity or comorbid conditions are defined as two or more coexisting medical conditions.

The first page of each selected DRG presents gender and age breakdowns of the overall hospital inpatient population, factored by the total number of discharges, average length of hospital stay and average billed charges. The age categories consist of 0-17, 18-35, 36-49, 50-64, and 65+. These age categories were selected to best illustrate the impact of the disease diagnoses and medical and surgical procedures on the populations affected. The narrative information on the first page for each DRG is based on the available data and may contain information on specific diagnoses and surgical procedures involved in the treatment of the patient. The second page examines specific hospitals in Clark, Washoe and the rural counties for the period 2000-2004, with regard to total discharges, average length of stays, and average billed charges.

It should be noted that, when comparing hospitals as to average length of stay and billed charges, information based on small numbers of cases cannot provide a reliable statistical base upon which information can reflect a given hospital's experience. Further, physician charges (including those of surgeons) are normally separate from hospital charges, except in rural areas where some physician services -- such as radiology, anesthesia, and laboratory tests -- may be included in the hospital charges.

General Acute Care Hospitals

| Name | Address | Phone | Beds | County |
|--|---|----------------|------|------------|
| Battle Mountain Gen. Hosp. | 535 Humboldt St., Battle Mountain, NV 89820 | (775) 635-2550 | 25 | Lander |

DRG 012: DEGENERATIVE NERVOUS SYSTEM DISORDERS

Description: The admitting diagnosis codes most commonly grouped to this DRG are Alzheimer's disease (ICD-9 code 331.0), dementia with behavioral disturbance (ICD-9 code 294.11), unspecified psychosis (ICD-9 code 298.9), and paraparesis agitans (ICD-9 code 332.0). ICD-9 codes 294.11 and 298.9 are respectively from DRG's 429 and 430, MDC 19. Persons are at times admitted under MDC 19, Mental Diseases and Disorders, and are later reclassified under MDC 1, Diseases and Disorders of the Nervous System. The most common principal diagnosis codes differ somewhat from the admitting codes. Of the top four, two are unique - other late effects of cerebrovascular disease (ICD-9 code 438.89), and myasthenia gravis (ICD-9 code 358.0).

Definitions: **Alzheimer's** - Presenile dementia. **Paraparesis Agitans** - A progressive nervous disease characterized by muscular tremor, slowing of movement, and partial facial paralysis. **Myasthenia Gravis** - Abnormal muscular weakness or fatigue.

DRG 014: SPECIFIC CEREBROVASCULAR DISORDERS EXCEPT T.I.A.

Diagnosis: In 2003, cerebrovascular diseases were the fourth leading cause of death in Nevada. In 2003, in Nevada 5.59% of all deaths were due to cerebrovascular diseases. The most common diagnoses in this DRG are intracranial hemorrhage (ICD-9 code 431), cerebral embolism with cerebral infarction (ICD-9 code 434.11) and cerebral artery occlusion with cerebral infarction (ICD-9 code 434.91) and cerebrovascular accident (ICD-9 code 436).

Definitions: **Cerebral:** referring to the brain. **Embolism:** a foreign object, quantity of air or gas, tissue or blood clot that circulates in the bloodstream until it becomes lodged in a vessel. **Intracranial:** the area within the skull. **Cerebrovascular:** the blood vessels and blood supply pertaining to the brain. **Hemorrhage:** a sudden loss of a large amount of blood in a short period, either internally or externally. **Infarction:** a localized area of dead tissue resulting from a lack of oxygen. It is caused by an interruption of the blood supply to the area or the occlusion of a blood vessel. **Occlusion:** a blockage in a canal, vessel or passage of the body. **T.I.A.:** transient ischemic attack, an episode of cerebrovascular insufficiency, usually associated with a partial occlusion of a cerebral artery by plaque or an embolus. **Cerebrovascular accident:** (AKA stroke) an abnormal condition characterized by an occlusion, embolus, blood clot, hemorrhage or vasospasm resulting in a lack of blood flow to the brain tissues.

DRG 015: TRANSIENT ISCHEMIC ATTACK (TIA) & PRECEREBRAL OCCLUSIONS

Diagnosis: The principal diagnosis codes most commonly grouped to this DRG include occlusion and stenosis of the carotid artery without mention of cerebral infarction (ICD-9 code 433.10) and transient ischemic attacks (ICD-9 code 435.9) and transient cerebral ischemia (ICD-9 code 435.8). A cerebrovascular accident (stroke) and a transient ischemic attack produce similar symptoms.

Definitions: **Transient ischemic attack:** an episode of cerebrovascular insufficiency, usually associated with partial occlusion of a cerebral artery by an atherosclerotic plaque or an embolus. The symptoms vary with the site and degree of occlusion. Disturbance of normal vision, dizziness, weakness, dysphasia, numbness or unconsciousness may occur. The attack can last a few minutes, in some cases symptoms continue for several hours. **Transient:** a condition that is temporary. **Ischemic:** a decreased supply of oxygenated blood. **Carotid:** refers to the arteries that supply oxygenated blood to the head and neck. **Stenosis:** constricting and narrowing of an opening or passageway. **Atherosclerotic:** yellowish plaques of cholesterol and cellular debris in the inner layers of the walls of the arteries. **Cerebrovascular:** the blood vessels and blood supply pertaining to the brain. **Embolism:** a foreign object, quantity of air or gas, tissue or blood clot that circulates in the bloodstream until it becomes lodged in a vessel.

DRG 024: SEIZURE & HEADACHE. AGE > 17 W CC

Definitions: **Seizure:** Hyperexcitation of neurons in the brain leading to a sudden, violent, involuntary series of contractions of a group of muscles. It may be episodic, as in a seizure disorder, or it may be acute, as after a head concussion. Focal seizures begin as spasmodic movements in the hand, face or foot. It may be manifested by chewing, lip smacking, swallowing movements and profuse salivation. **Headache:** a pain in the head from any cause. Kinds of headaches include cluster headache, functional headache, histamine headache, migraine headache, organic headache, sinus headache and tension headache. **Cluster headache:** a migraine-like condition characterized by intense pain over the eye and forehead. **Histamine headache:** a headache associated with the release of histamine from the body and marked by symptoms of dilated carotid arteries, fluid accumulation under the eyes, tearing and a runny nose. **Migraine:** a recurring vascular headache related to dilation of extracranial blood vessels. **Organic headache:** a headache caused by a wide variety of intracranial disorders. **Tension headache:** a pain that affects the head as a result of overwork or emotional strain and involves tension in the muscles of the neck, face and shoulder.

DRG 075: MAJOR CHEST PROCEDURES

Description: These are procedures which involve surgery on structures within the chest cavity, excluding the heart. The most common procedures are those involving the lungs and the esophagus.

Procedures (included but not limited to): **Bronchoscopy:** evaluation of all the major airways through a scope (a thin tube with a light on the end). **Thoroscopy:** surgery on the chest cavity through small incisions, aided by camera-mounted scopes. This is usually done for lung biopsies, treatment of fluid in the chest, or to treat a pneumothorax. **Wedge resection:** the surgical removal of a small wedge shaped portion of the lung. **Lobectomy:** surgical removal of a lobe or section of the lung. In Nevada in 2003 and in 2004, the most common procedures under DRG 075 were lobectomies of the lung (ICD-9 code 32.4), decortication of the lung (removal of thickened serous membrane for lung expansion), (ICD-9 34.51), and other excisions or destruction of lesions or tissues of the lung, resection (ICD-9 code 32.28).

Definition: Pneumothorax: the presence of air or gas in the pleural space (space enclosing the lung containing a small amount of fluid for lubrication) causing a lung to collapse.

Resection: the cutting out of a significant part of an organ.

NOTE: Northeastern was previously known as Elko General. Incline Village Medical Center was previously known as Lake Tahoe Hospital, then Tahoe Forest Hospital. Saint Rose Siena discharged its first patients in 2000. Lake Mead Hospital is now known as North Vista Hospital.

DRG 079: RESPIRATORY INFECTIONS & INFLAMMATIONS. AGE > 17 W CC

Diagnosis: The most common diagnoses associated with DRG 079 are pneumonia due to pseudomonas (ICD-9 code 482.1), pneumonia due to staphylococcus (ICD-9 code 482.40), pneumonia due to gram-negative organisms (ICD-9 code 482.83), and pneumonia due to inhalation of food or vomitus (ICD-9 code 507.0).

Definitions: **Pneumonia:** an acute inflammation of the lungs.

Pseudomonas: a genus of gram-negative bacteria that includes several free-living species in soil and water and some opportunistic pathogens. **Staphylococcus:** an infection caused by any one of several pathogenic species. Staphylococcus pneumonia often follows other viral disease and may be associated with chronic or debilitating illness.

Pathogen: a microorganism capable of producing disease.

NOTE: Northeastern was previously known as Elko General. Incline Village Medical Center was previously known as Lake Tahoe Hospital, then Tahoe Forest Hospital. Saint Rose Siena discharged its first patients in 2000. Lake Mead Hospital is now known as North Vista Hospital.

DRG 088: CHRONIC OBSTRUCTIVE PULMONARY DISEASE (COPD)

Diagnosis: The most common diagnoses in this DRG are chronic obstructive bronchitis with acute exacerbation (ICD-9 code 491.21), chronic obstructive asthma without mention of status asthmaticus (ICD-9 code 493.20) and, chronic obstructive pulmonary disease (COPD) (ICD-9 code 496).

Definitions: **Chronic obstructive pulmonary disease:** a progressive and irreversible condition characterized by diminished inspiratory and expiratory capacity of the lungs.

It includes asthma, chronic bronchiectasis, chronic bronchitis and emphysema. The condition is aggravated by cigarette smoking and air pollution. **Exacerbation:** an increase in the seriousness of a disease or disorder as marked by greater intensity in the signs or symptoms of the patient being treated.

Asthma: a respiratory disorder characterized by recurring episodes of breathing difficulty, wheezing on expiration and/or inspiration caused by constriction of the bronchi, coughing and thick bronchial secretions. **Status asthmaticus:** an acute, severe, and prolonged asthma attack. Hypoxia, cyanosis and unconsciousness may follow, and the attack may be fatal.

Hypoxia: inadequate oxygenation characterized by an high heart rate, high blood pressure, dizziness and mental confusion. **Cyanosis:** a bluish discoloration of the skin caused by an excess of deoxygenated blood. **Bronchiectasis:** an abnormal condition of the bronchial tree characterized by irreversible dilation and destruction of the bronchial walls.

DRG 089: SIMPLE PNEUMONIA & PLEURISY. AGE > 17 W CC

Diagnoses: The ICD-9 codes most commonly grouped to this DRG are pneumococcal pneumonia (ICD-9 code 481), and, pneumonia, organism unspecified (ICD-9 code 486).

Definitions: **W CC:** the presence of complications and comorbidities, i.e., alcoholism, congestive heart failure, dehydration, diabetes, malnutrition, renal failure. **Pneumonia:** an acute inflammation of the lungs, often caused by inhalation of the species streptococcus pneumoniae. The alveoli and bronchioles of the lungs become plugged with fibrous secretions. **Alveoli:** a small outpouching in the lungs through which gas exchanges from the pulmonary capillary blood. **Bronchioles:** a small airway of the respiratory system extending from the bronchi into the lobes of the lung. **Pleurisy:** inflammation of the membrane enclosing the lung.

DRG 098: BRONCHITIS & ASTHMA. AGE 0-17

Definitions: **Bronchitis:** an acute or chronic inflammation of the mucous membranes of the tracheobronchial tree. Acute bronchitis is characterized by a productive cough, fever, increased mucus secretion and back pain. Chronic bronchitis is a common debilitating pulmonary disease, characterized by greatly increased production of mucus by the glands of the trachea and bronchi and results in a productive cough for at least 3 months of the year for more than two consecutive years. **Asthma:** a respiratory disorder characterized by recurring episodes of breathing difficulty, wheezing on expiration and/or inspiration caused by constriction of the bronchi, coughing and thick bronchial secretions.

According to the Centers for Disease Control and Prevention (CDC), in 2002, 83 per 1,000 children (6.1 million) aged 0-17 years had been diagnosed with asthma. Children aged 5-17 years missed 14.7 million school days due to asthma. In 2002, children aged 0-17 years had 727,000 emergency department visits due to asthma. That is a rate of 100 per 10,000 emergency department visits.

DRG 110: MAJOR CARDIOVASCULAR PROCEDURES W CC

Diagnosis: In Nevada in 2003 and in 2004, the most common procedures under DRG 110 were implantations of heart and circulatory assist systems (pulsation balloon) (ICD-9 code 37.61), aorta-iliac-femoral bypasses (ICD-9 code 39.25), and resections of vessel with replacement (abdominal aneurysms) (ICD-9 code 38.44). Cardiovascular procedures include (but are not limited to) diagnostic cardiac catheterization, percutaneous transluminal coronary angioplasty procedures, coronary artery bypass graft procedures, cardiac pacemaker procedures, and heart valve procedures.

Definitions: **W CC:** with complications and comorbidities (an accompanying illness/es). **Cardiovascular disease:** any abnormal condition characterized by dysfunction of the heart and blood vessels. **Atherosclerosis:** yellowish plaques of cholesterol, other lipids and cellular debris in the inner layers of the walls of arteries. **Cardiac catheterization:** a diagnostic procedure in which a catheter is introduced into a large vein and threaded through the circulatory system to the heart. **Percutaneous transluminal coronary angioplasty:** a technique where some of the plaques in the heart are flattened against the arterial walls, resulting in improved circulation. **Bypass:** A procedure to divert the flow of blood thereby bypassing a narrowing or blockage in a blood vessel. **Aneurysm:** a localized dilation of the wall of a blood vessel.

NOTE: Northeastern was previously known as Elko General. Incline Village Medical Center was previously known as Lake Tahoe Hospital, then Tahoe Forest Hospital. Saint Rose Siena discharged its first patients in 2000. Lake Mead Hospital is now known as North Vista Hospital.

DRG 116: OTHER PERMANENT CARDIAC PACEMAKER IMPLANT

Definition: **Cardiac pacemaker:** an electric apparatus used in most cases to increase the heart rate by electrically stimulating the heart muscle. Most pacemakers are recommended when an individual experiences symptoms such as fatigue, weakness, lightheadedness, shortness of breath or fainting, related to an inappropriately slow heart rate. When the heart beats too slowly, it does not pump enough blood to meet the body's needs. A pacemaker may emit the stimulus at a constant and fixed rate, or fire only on demand. The pacemaker contains the battery and electronic circuitry which produce the electrical impulse needed to make the heart beat. The typical pacemaker is usually very small, usually 2 inches wide and $\frac{1}{4}$ inch thick. It is implanted in the upper chest just below the skin near the collar bone on either side of the body. A thin, insulated wire is inserted through a vein to connect the pacemaker to the heart.

Beginning fiscal 2002, with the addition of DRGs 516 and 517 many who might have been defined under 116 were now found under the new DRGs. This pattern was repeated in fiscal 2004 with the addition of DRGs 526 and 527.

DRG 122: CIRCULATORY DISORDERS W AMI W/O MAJOR CMP DISCHARGED ALIVE

Definitions: **W AMI:** with an acute myocardial infarction. **W/O Major Comp:** without major complications. **Acute myocardial infarction** (AKA heart attack): the early critical stage of necrosis of heart muscle tissue caused by a blockage of a coronary artery. **Necrosis:** Localized tissue death that occurs in groups of cells in response to disease or injury. **Coronary artery(s):** The heart has two main coronary arteries, the right and the left. The right coronary artery curves around the right side of the heart to supply blood to the front and back of that side. The left coronary artery supplies blood to the left side of the heart and has two distinct branches.

Atherosclerosis is the most common reason for the blockage of blood vessels. Atherosclerosis occurs when fat and cholesterol build up on the inside walls of hardened arteries. This build-up blocks or narrows the artery and prevents blood and oxygen from reaching the heart muscle.

Diseases of the heart was the leading cause of death in Nevada in 2003 with a crude rate of 2198.52 deaths per 100,000 population. 25.74% of all deaths in 2003 in Nevada, were due to heart disease.

DRG 125: CIRC. DISORDERS EXCEPT AMI, W CARD CATH W/O COMPLEX DIAG

Diagnosis: The most common principal diagnosis codes for this DRG are coronary atherosclerosis of native coronary artery disease (ICD-9 code 414.01), unspecified chest pain (ICD-9 code 786.50), and chest pain NEC (ICD-9 code 786.59).

Definitions: Except AMI: except acute myocardial infarction (heart attack). W Card Cath: with cardiac catheterization.

W/O Complex Diag.: without a complex diagnosis.

Coronary atherosclerosis: when fat and cholesterol build up on the inside walls of the coronary hardened artery(s). This build-up blocks or narrows the artery and prevents blood and oxygen from reaching the heart muscle.

Cardiac catheterization: a diagnostic procedure in which a catheter is introduced into a large vein and threaded through the circulatory system to the heart. **Coronary heart disease:** an abnormal condition that affects the heart's arteries and produces reduced flow of oxygen and nutrients to the muscles of the heart. It is the leading cause of death in the Western world.

Chest pain: a physical complaint that requires immediate diagnosis and evaluation. Chest pain can be a sign of cardiac disease, or of pulmonary (lung) disease. Over 90% of severe chest pain is caused by coronary artery disease, spinal root compression or a psychological disturbance.

NEC: means not elsewhere classifiable.

DRG 127: HEART FAILURE & SHOCK

Diagnosis: The principal diagnosis codes most commonly grouped to this DRG are hypertensive heart disease with congestive heart failure (ICD-9 code 402.91), and congestive heart failure (ICD-9 code 428.0).

Definitions: **Heart failure:** a condition in which the heart cannot pump enough blood to meet the requirements of the body tissues. Heart failure is closely associated with many forms of heart disease, most of which affect the left side of the heart. Clinicians divide heart failure into left-sided heart failure and right-sided heart failure. **Congestive heart failure:** impaired cardiac pumping, failure of the ventricles to eject blood efficiently results in volume overload. **Shock:** an abnormal condition of inadequate blood flow to the body's tissues, with life-threatening cellular dysfunction. **Hypertensive heart disease:** is a late complication of hypertension (high blood pressure) that affects the heart. Hypertension increases the workload of the heart and over time, this can cause thickening of the heart muscle and the symptoms of hypertensive heart disease. As the heart continues to pump against elevated pressure in the blood vessels, the left ventricle becomes enlarged and the amount of blood pumped by the heart each minute goes down, and without treatment, symptoms of congestive heart failure may develop.

DRG 132: ATHEROSCLEROSIS W CC

Diagnosis: The most common principal diagnosis codes for this DRG are coronary atherosclerosis of unspecified type of vessel, native or graft (ICD-9 code 414.00), and coronary atherosclerosis of native coronary artery (ICD-9 code 414.01).

Definitions: **W CC:** with complications and comorbidities (an accompanying illness/es). **Coronary atherosclerosis:** when fat and cholesterol build up on the inside walls of the coronary hardened artery(s). This build-up blocks or narrows the artery and prevents blood and oxygen from reaching the heart muscle. Coronary atherosclerosis is the major cause of myocardial infarctions (heart attacks). Heart attacks are the major cause of sudden unexpected death among otherwise healthy adults in the prime of their lives.

NOTE: Northeastern was previously known as Elko General. Incline Village Medical Center was previously known as Lake Tahoe Hospital, then Tahoe Forest Hospital. Saint Rose Siena discharged its first patients in 2000. Lake Mead Hospital is now known as North Vista Hospital.

DRG 138: CARDIAC ARRHYTHMIA & CONDUCTION DISORDERS W CC

Diagnosis: The most common principal diagnosis codes for this DRG are paroxysmal ventricular tachycardia (ICD-9 code 427.1), atrial fibrillation (ICD-9 code 427.31), atrial flutter (ICD-9 code 427.32), sinoatrial node dysfunction (ICD-9 code 427.81).

Definitions: **W CC:** with complications and comorbidities (an accompanying illness(es)). **Paroxysmal ventricular tachycardia:** a rapid heartbeat of sudden onset and termination caused by a quick succession of discharges from an ectopic (an impulse that originates in the heart at a site other than the sinus node) site in the ventricle. **Atrial fibrillation:** a cardiac arrhythmia characterized by disorganized electrical activity in the atria accompanied by an irregular ventricular response that is usually rapid. The atria quiver instead of pumping in an organized fashion, increasing the risk of stroke. **Atrial flutter:** a type of atrial tachycardia (rapid beating of the atria) characterized by contraction rates between 230-380 beats per minute. **Sinotrial node dysfunction:** any disturbance in the normal functioning of the sinoatrial node (a cluster of hundreds of cells located in the right atrial wall of the heart. It's comprised of heart muscle that generates impulses that travel swiftly throughout the both atria, causing them to contract). **Cardiac dysrhythmias:** any abnormality in a cardiac rhythm pattern.

DRG 143: CHEST PAIN

Diagnosis: The most common principal diagnosis codes for this DRG are chest pain, unspecified (ICD-9 code 786.50), and chest pain NEC (ICD-9 code 786.59).

Definitions: **NEC:** not elsewhere classifiable. **Chest pain:** a physical complaint that requires immediate diagnosis and evaluation. Chest pain can be a sign of cardiac disease, or of pulmonary (lung) disease. Over 90% of severe chest pain is caused by coronary artery disease, spinal root compression or a psychological disturbance.

Angina (a spasmodic choking feeling) at rest, and heart attack caused by a blood clot in a coronary artery are the most common causes of chest pain. Less common, but also life-threatening, conditions that cause chest pain include aortic dissection, pulmonary embolism, and pneumothorax. **Aortic dissection:** a localized dilation of the aorta, characterized by longitudinal separation of the outer and middle layers of the vascular wall. **Pulmonary embolism:** a blockage of the pulmonary artery by fat, tumor tissue or a blood clot.

Pneumothorax: the presence of air or gas in the pleural space (the membrane enclosing the lung containing a small amount of fluid for lubrication), causing the lung to collapse.

DRG 148: MAJOR SMALL & LARGE BOWEL PROCEDURES W CC

Procedures: Surgical procedures under DRG 148 include but are not limited to, resections of the bowel, permanent or temporary colostomies, ileostomies, repair of abnormal passages known as fistulas, and the surgical joining of sections of the bowel known as an anastomosis. In Nevada in 2003, and in 2004, the most common procedures under DRG 148 were resections of partial sections of the small intestine (ICD-9 code 45.62), right hemicolectomies (ICD-9 code 45.73) and sigmoidectomies (ICD-9 code 45.76).

Definitions: W CC: means with complications and comorbidities (an accompanying illness/es). **Resection:** the cutting out of a significant part of an organ or structure, may be partial or complete. **Hemicolectomy:** excision of approximately half of the colon. **Sigmoidectomy:** excision of the sigmoid flexure of the colon. A **colostomy** and an **ileostomy** are surgical formations of an opening onto the surface of the abdomen from which waste from the bowel is emptied. These procedures may be performed in cases of cancer of the colon, benign obstructive tumors, severe abdominal wounds, severe ulcerative colitis, and Crohn's disease.

Description: The small intestine, (small bowel) is a tubelike structure that winds back and forth in the abdominal cavity for about 23 feet. It is an organ of digestion and it is the chief organ of absorption. The large intestine (large bowel) is wider in diameter. The large intestine is about 5 feet long.

DRG 167: APPENDECTOMY W/O COMPLICATED PRINCIPAL DIAG W/O CC

Procedure: An appendectomy is the surgical removal of an inflamed or infected appendix. The appendix is a small, finger-shaped pouch of intestinal tissue extending from the cecum, which is the first part of the large intestine. The infected appendix must be surgically removed because if it leaks, this can lead to an infection of the entire abdominal space, which can be fatal.

A small incision is made in the right lower quadrant of the abdomen and the appendix is removed. The appendix may be removed laparoscopically (with a smaller incision, using a tiny camera to visualize the area). If a pocket of infection or abscess has formed or the appendix has ruptured, the abdomen will be thoroughly washed out during surgery and a small tube may be left in to help drain fluids and purulent matter, and appropriate antibiotics prescribed.

Definitions: **Appendicitis:** a sudden inflammation of the appendix. **W/O CC:** without complications and comorbidities (an accompanying illness/es). **W/O complicated principal diag.:** without a complicated principal diagnosis.

DRG 174: G.I. HEMORRHAGE W CC

Description: Hemorrhage is the loss of a large amount of blood in a short period of time. Gastrointestinal (GI) hemorrhage can occur in the esophagus, stomach, duodenum, and small and large intestine. Causes of hemorrhage of the GI tract include but are not limited to, esophageal varices, stomach ulcers, duodenal ulcers, peptic ulcers, acute gastritis, diverticulitis, and diverticulosis.

Definitions: **W CC:** with complications and comorbidities (an accompanying illness/es). **Esophageal varices:** enlarged and swollen veins at the lower end of the esophagus. **Diverticulosis:** is the presence of pouchlike herniations through the muscular layer of the colon. **Diverticulitis:** inflammation of one or more of these pouchlike herniations. **Duodenum:** the first part of the small intestine. It is located below the stomach.

NOTE: Northeastern was previously known as Elko General. Incline Village Medical Center was previously known as Lake Tahoe Hospital, then Tahoe Forest Hospital. Saint Rose Siena discharged its first patients in 2000. Lake Mead Hospital is now known as North Vista Hospital.

DRG 182: ESOPHAGITIS, GASTROENT & MISC DIGEST DISORDERS AGE > 17 W CC

Diagnosis: Under this DRG, diagnoses include, but are not limited to, intestinal infections, esophageal reflux, noninfectious gastroenteritis, and diverticulitis of the colon.

Definitions: **Esophagitis:** inflammation of the mucosal lining of the esophagus. It can be caused by infection, or backflow of gastric juices from the stomach. **Gastroenteritis:** inflammation of the stomach and intestines accompanying numerous gastrointestinal disorders. **Diverticulitis:** inflammation of one or more pouchlike herniations through the muscular layer of the colon. **Reflux:** an abnormal backward flow of a fluid.

DRG 202: CIRRHOSIS & ALCOHOLIC HEPATITIS

Description: Cirrhosis is a chronic liver disease that causes scarring of the liver and liver dysfunction. This often has many complications, including accumulation of fluid in the abdomen (ascites), bleeding disorders (coagulopathy) increased pressure in the blood vessels (portal hypertension) and confusion or a change in the level of consciousness (hepatic encephalopathy). Common causes include hepatitis C and alcohol use.

The liver is the largest organ in the human body. The liver helps the body digest fats, stores reserves of nutrients, filters poisons and wastes from the blood, synthesizes proteins, and regulates the levels of many chemicals found in the bloodstream.

Definition: Hepatitis: inflammation of the liver, characterized by anorexia, abdominal and gastric discomfort and abnormal liver function.

DRG 204: DISORDERS OF PANCREAS EXCEPT MALIGNANCY

Diagnosis: Diagnoses in DRG 204 include, but are not limited to, pancreatitis, benign neoplasms of the pancreas, pancreatic disease, and pancreas injury.

Description: The pancreas is a small organ, approximately six inches long, located in the upper abdomen, and connected to the small intestine. The pancreas produces enzymes that help digest protein, fat and carbohydrates before they can be absorbed through the intestine and it makes islands of endocrine cells that produce insulin which regulate the use and storage of the body's main energy source, glucose and sugar.

Definitions: **Pancreatitis:** inflammation of the pancreas. Inflammation occurs when the digestive enzymes attack the pancreas. The inflammation may occur suddenly or develop over many years. **Neoplasm:** any abnormal growth of new tissue. Benign means noncancerous. **Malignancy:** describing a cancer.

NOTE: Northeastern was previously known as Elko General. Incline Village Medical Center was previously known as Lake Tahoe Hospital, then Tahoe Forest Hospital. Saint Rose Siena discharged its first patients in 2000. Lake Mead Hospital is now known as North Vista Hospital.

DRG 209: MAJOR JOINT & LIMB REATTACHMENT PROCS OF LOWER EXTREMITY

Procedure: DRG 209 includes but is not limited to, hip, knee, ankle replacements, and foot, leg, ankle and thigh reattachment.

In Nevada in 2003 and in 2004, the most common procedures under DRG 209 were total knee replacements (ICD-9 code 81.54), then total hip replacements (ICD-9 code 81.51), then partial hip replacements (ICD-9 code 81.52).

Definitions: **Hip replacement:** the substitution of an artificial ball and socket joint for the hip joint. **Knee replacement:** a surgical procedure in which injured or damaged parts of the knee joint are replaced with artificial parts. **Lower extremity:** part(s) of the leg(s).

DRG 210: HIP & FEMUR PROCEDURES EXCEPT MAJOR JOINT. AGE > 17 W CC

Procedures: Included, but not limited to, in this DRG are open reductions and closed reductions, internal fixations, bone grafts, and osteoclases of the femur. In Nevada in 2003 and in 2004, the most common procedures under DRG 210 were open reduction of fractures with internal fixation of the femur (ICD-9 code 79.35), closed reductions of fractures with internal fixation of the femur (ICD-9 code 79.15) and internal fixations of bone without fracture reduction of the femur (ICD-9 code 78.55).

Definitions: **Open reduction:** a surgical procedure for reducing a fracture or dislocation. A closed reduction is the manual correction of a fracture without an incision. **Internal fixation:** a method of holding together the fragments of a fractured bone. After open reduction of the fracture, pins, wires, screws, plates or nails may be used to stabilize the fragments. **Bone graft:** the transplantation of a piece of bone from one part of the body to another to repair a skeletal defect. **Osteoclasis:** the intentional surgical fracture of a bone to correct a deformity. **Femur:** the thigh bone that extends from the pelvis to the knee. Is it the longest and strongest bone in the body. **Closed reduction:** the manual corrections of fractures without incisions.

DRG 243: MEDICAL BACK PROBLEMS

Diagnosis: Diagnoses under this DRG, include but are not limited to, displacement of lumbar intervertebral disc without myelopathy, spinal stenosis, lumbago, closed fracture of dorsal vertebra and closed fracture of lumbar vertebra.

Definitions: **Vertebra:** any one of the bones of the spinal column. **Intervertebral:** the space between two vertebrae. **Myelopathy:** disease of the spinal cord. **Stenosis:** an abnormal condition characterized by the constriction or narrowing of an opening or passageway in a body structure. **Lumbago:** pain in the lumbar, lower, region of the spinal cord caused by muscle strain, rheumatoid arthritis, osteoarthritis, or a herniated intervertebral disk. **Fracture:** a traumatic injury to a bone in which the continuity of the bone tissue is broken. **Dorsal:** the back of something.

DRG 294: DIABETES AGE > 35

Description: Diabetes is a disease caused by a deficiency of insulin or a decreased ability of the body to use insulin, a hormone secreted by the pancreas. Diabetes is classified into two main types, type 1 and type 2. Type 1 diabetes (insulin-dependent), affects 5%-10% of those with diabetes and most often occurs during childhood or adolescence. Type 2 diabetes (non-insulin dependent) is the more common type, affecting 90%-95% of those with diabetes. Type 2 diabetes usually occurs after age 40. Diabetic patients risk debilitating complications such as blindness, kidney disease, diabetic nerve damage, and lower extremity amputations. Cardiovascular disease, stroke, and high blood pressure is more common among persons with diabetes. Gestational diabetes occurs in women when glucose intolerance develops during pregnancy.

Insulin lowers blood glucose levels and promotes transport and entry of glucose into the muscle cells and other tissues.

NOTE: Northeastern was previously known as Elko General. Incline Village Medical Center was previously known as Lake Tahoe Hospital, then Tahoe Forest Hospital. Saint Rose Siena discharged its first patients in 2000. Lake Mead Hospital is now known as North Vista Hospital.

DRG 296: NUTRITIONAL & MISC METABOLIC DISORDERS AGE > 17 W CC

Diagnosis: Included, but not limited to, in this DRG are hypoglycemic coma, malnutrition, nutrition deficiency, anorexia, feeding problems, hypovolemia, abnormal weight gain, abnormal loss of weight, and fluid overload.

Definitions: **Hypovolemia:** an abnormally low circulating blood volume. **Hypoglycemia:** a less than normal amount of glucose in the blood, usually caused by administration of too much insulin, excessive secretion of insulin by the pancreas, or dietary deficiency. **Anorexia:** a lack or loss of appetite, resulting in the inability to eat. **Fluid overload:** an excessive accumulation of fluid in the body. **Malnutrition:** an imbalance between the body's needs and the intake of nutrients. Malnutrition includes undernutrition, in which nutrients are undersupplied, and overnutrition, in which nutrients are oversupplied. **Metabolic disorders:** any dysfunction that results in loss of control of homeostasis (the relative constancy in the internal environment of the body) in the body.

DRG 316: RENAL FAILURE

Description: The kidneys are two fist-sized organs located on each side of the spine at the bottom of the rib cage and slightly above the waist.

Renal failure is the inability of the kidneys to excrete wastes, concentrate urine and conserve electrolytes. The condition may be acute or chronic. In chronic kidney disease, the kidneys have not stopped working altogether but are not working as well as they should. Acute renal failure occurs when the kidneys stop working over a period of hours, days or in some cases, weeks. When acute renal failure occurs, wastes and excess waste products and excess water build up in the body which upsets the body's normal chemical balance. Substances that are normally needed for the body to function properly become poisonous to the body when they reach abnormally high levels.

DRG 320: KIDNEY & URINARY TRACT INFECTIONS AGE > 17 W CC

Description: The urinary tract consists of the kidneys, ureters, bladder and urethra, all organs and ducts involved with the secretion and elimination of urine from the body. A urinary tract infection can occur in one or more structures of the urinary tract. A urinary tract infection is more common in women than in men.

Definitions: **Pyelonephritis:** a kidney infection, usually from bacteria that spread from the bladder. An untreated or recurrent kidney infection can lead to chronic pyelonephritis, scarring of the kidneys, and permanent kidney damage.

Interstitial cystitis: a chronic inflammation of the bladder wall. Its cause is unknown. **Common cystitis:** a urinary tract infection caused by bacteria and is usually successfully treated with antibiotics. Interstitial cystitis is believed not to be caused by bacteria and does not respond to conventional antibiotic therapy. **W CC:** with complications and comorbidities (an accompanying illness/es).

DRG 359: UTERINE & ADNEXA PROCEDURES FOR NON-MALIGNANCY W/O CC

Procedures: Procedures under this DRG include, but are not limited to, open uterine biopsy, total abdominal hysterectomy, removal of the fallopian tube and ectopic pregnancy, and manual rupture of an ovarian cyst.

Definitions: **Uterus:** a pear-shaped, hollow organ located in the pelvis of females. In pregnancy, it is the organ that holds the unborn developing child. **Adnexa:** tissues or structures that are adjacent or near the uterus, such as the ovaries and fallopian tubes. **Hysterectomy:** the surgical removal of the uterus. **Ectopic pregnancy:** also known as a tubal pregnancy is a potentially life-threatening form of pregnancy in which implantation of the fertilized egg occurs outside the uterus. **Ovarian cyst:** a sac filled with fluid or semisolid material that develops in or on the ovary. **W/O CC:** without complications and comorbidities (an accompanying illness/es). **Non-malignancy:** not cancer. **Fallopian tube:** one of a pair of ducts, one opening at one end into the uterus and the other end into the peritoneal cavity over the ovary.

NOTE: Northeastern was previously known as Elko General. Incline Village Medical Center was previously known as Lake Tahoe Hospital, then Tahoe Forest Hospital. Saint Rose Siena discharged its first patients in 2000. Lake Mead Hospital is now known as North Vista Hospital.

DRG 391: NORMAL NEWBORN

Description: On average, birth weights range from five pounds five ounces to eight pounds. The pulse of a newborn ranges from 100 to 170 beats per minute when awake, 70 to 80 when sleeping deeply. They take an average of 30 to 50 breaths per minute. Nearly all fair-skinned babies are born with blue or gray eyes, which may gradually change color over the first 12 months. Darker-skinned babies most often are born with brown or darker eyes, which usually stay that color. Dark-haired babies usually stay that way, but blond hair often darkens with age. Newborn babies have a soft spot, also known as the fontanel, that is diamond shaped just above the hairline, where the baby's skull bones have not yet fused together.

DRG 416: SEPTICEMIA AGE > 17

Diagnosis: Diagnoses under this DRG include, but are not limited to, streptococcal septicemia, septicemia due to Escherichia coli, and staphylococcal aureus septicemia.

Definitions: **Septicemia:** an infection present in the circulating blood, having spread from an infection in any part of the body. It is diagnosed by a culture of the blood and is treated with antibiotics. Septicemia causes fever, chills, hypotension, pain, headache, nausea or diarrhea.

Severe sepsis: occurs when the body's normal reaction goes into overdrive, setting off a series of events that can lead to widespread inflammation and blood clotting throughout the body, causing tissue damage, leading to organ failure. **Septic shock:** occurs in severe sepsis when the cardiovascular system fails and blood pressure drops, depriving vital organs of oxygenated blood.

DRG 430: PSYCHOSES

Diagnosis: Diagnoses in this DRG include, but not limited to, paranoia, bipolar affect, schizophrenia-chronic, recurrent manic disorder-severe, and catatonia-chronic.

Description: **Psychosis:** any major mental disorder that causes a person to lose his or her sense of reality. People with psychosis have hallucinations, delusions, or disorganized thinking that cause them to lose touch with reality. Someone who is psychotic may hear voices that no one else can hear, or perceive threats that are not real. It is often characterized by regressive behavior, inappropriate mood and affect, and diminished impulse control. **Bipolar affect:** a major mental disorder characterized by episodes of mania, depression, or mixed mood. **Schizophrenia:** psychotic disorder characterized by gross distortion of reality, disturbances of language and communication, withdrawal from social interaction and fragmented thoughts, perception and emotional reaction. **Catatonia:** psychologically induced immobility with muscular rigidity, at times interrupted by agitation.

DRG 449: POISONING & TOXIC EFFECTS OF DRUGS. AGE > 17 W CC

Description: Poisoning is a condition produced by the ingestion of, injection of, inhalation of, or exposure to a poisonous substance. Identification of the poison and presentation of a container label are critical to diagnosis and treatment.

A poison is any substance that can cause harmful effects in the body. According to the American Association of Poison Control Centers, millions of people are unintentionally poisoned every year, and children under the age of six are at the greatest risk. The most dangerous poisons are medicines, including iron pills, cleaning products that can cause burns (drain opener, toilet bowl cleaner, oven cleaner, rust remover), antifreeze, windshield washer solution, hydrocarbons (furniture polish, lighter fluid, lamp oil, kerosene, turpentine, paint thinner), carbon monoxide, pesticides and wild mushrooms.

In 2003, there were 263 accidental poisoning deaths in Nevada (30.1% of total accidental deaths). There were 81 suicide deaths by poisoning (19.1% of all suicide deaths).

DRG 494: LAPAROSCOPIC CHOLECYSTECTOMY W/O C.D.E. W/O CC

Procedure: Laparoscopic cholecystectomy (without common duct exploration without complications and comorbidities) is the surgical removal of the gall bladder with the assistance of a laparoscope (a small video camera attached to a tube). In laparoscopic surgery, the abdomen is inflated with carbon dioxide to provide more room for the procedure. Through a small incision made at the navel, a laparoscope is inserted into the abdomen. Three small additional holes are made to allow the entry of surgical instruments. The gallbladder is located and removed. Laparoscopic surgery has a lower rate of complications, a shorter hospital stay, and a better cosmetic results than the open procedure.

NOTE: Northeastern was previously known as Elko General. Incline Village Medical Center was previously known as Lake Tahoe Hospital, then Tahoe Forest Hospital. Saint Rose Siena discharged its first patients in 2000. Lake Mead Hospital is now known as North Vista Hospital.

DRG 498: SPINAL FUSION EXCEPT CERVICAL W/O CC

Description: Spinal fusion involves surgical treatment of abnormalities in the spine bones (vertebrae). The surgery stabilizes the back by fusing certain vertebrae together with bone grafts or metal rods. The most common spinal area involved is the lower (lumbar) spine.

A spinal fusion may be recommended for an abnormal curvature of the spine (scoliosis, kyphosis), injury to the spinal vertebrae, protrusion of the cushioning disc between vertebrae (slipped disk, herniated nucleus pulposus), and weak or unstable spine caused by infections or tumors.

Definitions: **W/O CC:** without complications and comorbidities (an accompanying illness/es). **Cervical:** pertaining to the neck or the region of the neck.

NOTE: Northeastern was previously known as Elko General. Incline Village Medical Center was previously known as Lake Tahoe Hospital, then Tahoe Forest Hospital. Saint Rose Siena discharged its first patients in 2000. Lake Mead Hospital is now known as North Vista Hospital.

DRG 500: BACK & NECK PROCEDURES EXCEPT SPINAL FUSION W/O CC

Description: Procedures included in this DRG include, but are not limited to, spinal cord exploration, excision of a spinal cord lesion, vertebral fracture repair, and insertion of a spinal stimulator. The spinal cord is an extension of the brain. It is protected by a bony structure called the vertebral or spinal column. There is a wide space that surrounds the spinal cord. This space contains the cerebrospinal fluid. All the information going from the brain to the limbs travels through the spinal cord. This then allows for movement. The spinal cord is the first relay station for sensory information (what we feel in our arms and legs) on its way to consciousness in various centers of the brain.

In Nevada in 2003 and in 2004, the most common procedures under DRG 500 were excisions of intervertebral disc(s) (ICD-9 code 80.51), explorations and decompressions of the spinal canal (ICD-9 03.09), and implantations or replacements of spinal neurostimulator lead(s) (ICD-9 code 03.93).

Definitions: **W/O CC:** without complications and comorbidities (an accompanying illness/es). **Spinal fusion:** surgical treatment of abnormalities in the spine bones (vertebrae). The surgery stabilizes the back by fusing certain vertebrae together with bone grafts or metal rods. **Decompression:** the removal of pressure.
