Data for the graphs and tables on the following pages are provisional and may be updated as additional information becomes available.

**Purpose**

The purpose of this report is to provide an overview of and statistics for the influenza season in Nevada for the local public health authorities, sentinel providers and the public.

**Sentinel Provider Data: Influenza-Like Illness Network Surveillance (ILINet)**

Respiratory specimens are tested for influenza by the World Health Organization (WHO) and National Respiratory and Enteric Virus Surveillance System (NRVESS) collaborating laboratories by sub-type. During week 7, there were 55,744 specimens collected and tested for influenza, of those 14,715 were positive (26.4%).

![Chart 1: National Influenza Positive Tests by Week](Chart1.png)

The Nevada total includes laboratory tests for all Nevada residents tested by sentinel providers including out of state laboratories. Laboratory data is obtained from CDC’s ILINet system. During week 7, where there were 11 specimens collected, in which 8 were positive. There is a two-week delay for laboratory surveillance. Data are subject to change as we receive additional reports.

![Chart 2: Nevada (ILI Providers) Influenza Laboratory Confirmed Positive by Week](Chart2.png)

*Source of Data: CDC: ILINet.*
Nevada State Public Health Laboratory (NSPHL) has tested 492 specimens for influenza from sentinel providers, of which there have been 427 positive (86.8%). Southern Nevada Public Health Laboratory (SNPHL) has tested 71 specimens this season of which there have been 5 positive. Nationally, there have been 872,675 specimens sent to the WHO and NERVSS laboratories of which 196,673 have been positive (22.5%). The national numbers in Table 1 are reflected in Figure 1. The state of Nevada data in Table 1 is reflected in Figure 2. The Nevada total includes laboratory test for all Nevada residents tested by sentinel providers, including out of state laboratories.

**Influenza A:**
- A (2009 H1N1): 308
- A (H5): 292
- A (Sub-typing not performed): 0

**Influenza B:**
- B (Victoria Lineage): 119
- B (Yamagata Lineage): 118
- B (Sub-typing not performed): 0

**Source of Data:** CDC: FluView Report and CDC: ILINet.

Influenza-like Illness (ILI) Surveillance Network has each sentinel provider report the number of patients seen that meet the ILI case definition and the total number of patients seen for any reason each week. The "percentage of visits for ILI" is the number of ILI patients divided by the total number of patients visit per week. Nevada’s percentage of ILI visits for week 7 is 3.3% which is above the state baseline of 1.5%. Region 9 ILI percentage for week 7 is 4.0% which is the above the region baseline of 2.4%. Region 9 includes the following states/territory: Arizona, California, Guam, Hawaii, and Nevada. The national ILI percentage for week 7 is 6.4% which is above the national baseline 2.2%.

### Figure 3

**Percentage of Visits for ILI Reported to Outpatient ILI Surveillance Network, Comparison Between National, Regional, and State, 53 Week Comparison (2017 WK 7 - 2018 WK 7)**

**Source of Data:** CDC: FluView Report and CDC: ILINet.

During week 7, 3.3% of visits to sentinel providers were due to ILI; this is greater than the 2016-2017 influenza season (1.3%). There were 10,921 patients seen by sentinel providers during week 7, of which 357 patients presented with ILI; week 7 of 2017, there were 248 patients seen with ILI (18,740 total patients seen). Data availability depends on sentinel provider reporting.
Influenza-like Illness is reported by age groups. During week 7, patients ages 0-4 were the greatest number of patients seen with ILI, at 106 patients seen. The rate for week 7 is 12.0 per 100,000 population. The rate is calculated by the number of patients presented with ILI, divided by the state population, multiplied by 100,000. The estimated state population for 2018 is 2,969,849.

Influenza Positive Surveillance (NBS and NETSS)

Positive cases of influenza are reported to the state health authority for surveillance purposes. Table 2 and Figure 7 reflect all positive influenza cases reported to the state. Types of influenza testing include commercial rapid diagnostic test (rapid), viral culture, fluorescent antibody, enzyme immunoassay, RT-PCR (PCR), and Immunohistochemistry. The two most common test types in Nevada are Rapid and PCR tests. During week 7, there were 869 influenza cases reported to the state, 282 influenza A, 545 influenza B and 42 unknown subtyping.

Pneumonia and Influenza (P&I) Mortality Surveillance

The Pneumonia and Influenza (P&I) mortality percentage is all deaths, where Pneumonia or Influenza is listed as the underlying or contributing cause of death, divided by the total deaths in Nevada for each week. As of February 26th, there were 36 P&I deaths and 339 total deaths for week 7 in Nevada. Please note that the CDC does not have updated P&I counts for week 6 or week 7.

Source: OVR: WEVRRS and CDC: FluView.
Technical Notes

- Data are subject to changes, additionally, there is a lag in reporting.
- Influenza surveillance procedures vary by jurisdiction.
- Influenza-like illness (ILI): a fever greater than or equal 100°F with cough and/or sore throat.
- Percent positive: The number of positive influenza laboratory tests divided by the total number of tests performed.
- Incidence rate is per 100,000 population as estimated by the state demographer.

This report contains information from national and state-level data sources. Influenza surveillance data is collected by various systems, including:

- Influenza-like Illness Network (ILINet): a sentinel surveillance system in collaboration with the Centers for the Disease Control and Prevention (CDC) where outpatient providers report ILI information weekly.
- National Electronic Telecommunication System for Surveillance (NETSS): a system whereby data is transmitted to CDC. Influenza data collected through NETSS does not provide influenza sub-typing information.
- National Electronic Disease Surveillance System (NEDSS): a system for collecting data and monitoring disease trends and outbreaks.
- NEDSS Based System (NBS): an implementation of the NEDSS standards. It provides a secure, accurate, and efficient means of collecting, transmitting, and analyzing public health data.
