November 2016
Edition 1.0
Data for the graphs and tables on the following pages are provisional and may be updated as additional information becomes available.

**Purpose**

The purpose of this report is to provide an overview of and statistics for the influenza season in Nevada for the local public health authorities, sentinel providers and the public.

**Influenza-Like Illness Network Surveillance (ILINet)**

Respiratory specimens are tested for influenza by the World Health Organization (WHO) and National Respiratory and Enteric Virus Surveillance System (NRVESS) collaborating laboratories by sub-type. During week 45, there were 15,533 specimens collected and tested for influenza, of those 316 were positive (2.0%).

**Figure 1**

![National Influenza Positive Tests by Week](image)

The Nevada total includes laboratory tests for all Nevada residents including out of state laboratories. During week 45, there were 34 specimens collected and 10 were positive (29.4%).

Influenza Weekly Report

Nevada State Public Health Laboratory (NSPHL) has tested 46 specimens for influenza from sentinel providers, of which there have been 30 positive (65.2%). Southern Nevada Public Health Laboratory (SNPHL) has tested 20 specimens this season of which there have been 0 positives. Nationally, there have been 90,075 specimens sent to the WHO and NERSS laboratories of which 2,002 have been positive or 2.2%. The national numbers in Table 1 are reflected in Figure 1. The state of Nevada data in Table 1 is reflected in Figure 2. The Nevada total includes laboratory test for all Nevada residents including out of state laboratories.

Source of Data: CDC: FluView Report and CDC: ILINet.

Influenza-like Illness (ILI) Surveillance Network has each sentinel providers report the number of patients that meet the ILI case definition and number of patients that visit the provider weekly. The “percentage of visits” is the number of ILI patients divided by the total number of patients visit per week. Nevada’s ILI percentage of visits to providers for week 45 is 1.1% and is below the state baseline 1.5%. Region 9 ILI percentage for week 45 is 1.1% and is below the region baseline 2.5%. Region 9 includes the following states/territory: Arizona, California, Guam, Hawaii, and Nevada. The national ILI percentage for week 45 is 1.7% and is below the national baseline 2.2%.

Figure 3

During week 45, 1.1% of visits to sentinel providers were due to ILI; this is lower than the 2015-2016 influenza season (0.8%). There were 17,144 patients seen by ILI providers during week 45, of which 187 patients presented with ILI; week 45 of 2015, there were 131 patients seen with ILI (16,647 total patients seen).
Influenza-like Illness is reported by age groups, during week 45, patients age 5-24 were the greatest number of patients seen with ILI, at 65 patients seen. The rate for week 45 is 6.4 per 100,000 population. The rate is calculated by the number of patients presented with ILI, divided by the state population, multiplied by 100,000. The estimated state population for 2016 is 2,902,853.

Influenza Positive Surveillance (NBS and NETSS)

Positive cases of influenza are reported to the state health authority for surveillance purposes. Table 2 and Figure 6 reflect all positive influenza cases reported to the state. Types of influenza testing include commercial rapid diagnostic test (rapid), viral culture, fluorescent antibody, enzyme immunoassay, RT-PCR (PCR), and Immunohistochemistry. The two most common test types in Nevada are Rapid and PCR tests. During week 45, there were 137 influenza cases reported to the state, 121 influenza A and 7 influenza B.

Pneumonia and Influenza (P&I) Mortality Surveillance

The Pneumonia and Influenza (P&I) mortality percentage is the deaths, where Pneumonia or Influenza is listed as the underlying or contributing cause of death, divided by the total deaths in Nevada for each week. As of November 29, there were 33 P&I deaths and 315 total deaths for week 45 in Nevada. The P&I mortality percent for Nevada is above the threshold at 10.5% (threshold 6.7%). Nationally, the P&I mortality is below the national epidemic threshold at 5.5% for week 45.

Figure 7
Technical Notes

- Influenza-like illness (ILI): a fever greater than or equal 100°F with cough and/or sore throat
- Percent positive: The number of positive influenza laboratory tests divided by the total number of tests performed.
- Incidence rate is per 100,000 population as estimated by the state demographer.
- Data are subject to changes.

This report contains information from national and state-level data sources. Influenza surveillance data is collected by a various systems, including:

- Influenza-like Illness Network (ILINet): a sentinel surveillance system in collaboration with the Centers for the Disease Control and Prevention (CDC) where outpatient providers report ILI information weekly.
- National Electronic Telecommunication System for Surveillance (NETSS): a system whereby data is transmitted to CDC. Influenza data collected through NETSS does not provide influenza subtyping information.
- National Electronic Disease Surveillance System (NEDSS): a system for collecting data and monitoring disease trends and outbreaks.
- NEDSS Based System (NBS): an implementation of the NEDSS standards. It provides a secure, accurate, and efficient means of collecting, transmitting, and analyzing public health data.
