Data for the graphs and tables on the following pages are provisional and may be updated as additional information becomes available.

**Purpose**

The purpose of this report is to provide an overview of and statistics for the influenza season in Nevada for the local public health authorities, sentinel providers and the public.

**Sentinel Provider Data: Influenza-Like Illness Network Surveillance (ILINet)**

Respiratory specimens are tested for influenza by the World Health Organization (WHO) and National Respiratory and Enteric Virus Surveillance System (NRVSS) collaborating laboratories by sub-type. During week 18, there were 11,047 specimens collected and tested for influenza, of those 827 were positive (7.5%).

**Figure 1**

![National Influenza Positive Tests by Week 53 Week Comparison (2016 WK 18 - 2017 WK 18)](image)

The Nevada total includes laboratory tests for all Nevada residents tested by sentinel providers including out of state laboratories. Laboratory data is obtained from CDC’s ILINet system. During week 18, where there were 9 specimens collected and 0 were positive. There is a two week delay for laboratory surveillance. Data are subject to change as we receive additional reports.

**Figure 2**

![Nevada (ILI Providers) Influenza Laboratory Confirmed Positive by Week 53 Week Comparison (2016 WK 18 - 2017 WK 18)](image)

Source of Data: CDC: ILINet.
Nevada State Public Health Laboratory (NSPHL) has tested 343 specimens for influenza from sentinel providers, of which there have been 291 positive (84.8%). Southern Nevada Public Health Laboratory (SNPHL) has tested 75 specimens this season of which there have been 7 positives. Nationally, there have been 906,576 specimens sent to the WHO and NERVSS laboratories of which 158,222 have been positive (17.5%). The national numbers in Table 1 are reflected in Figure 1. The state of Nevada data in Table 1 is reflected in Figure 2. The Nevada total includes laboratory test for all Nevada residents tested by sentinel providers, including out of state laboratories.

**Source of Data:** CDC: FluView Report and CDC: ILINet.

Influenza-like Illness (ILI) Surveillance Network has each sentinel provider report the number of patients seen that meet the ILI case definition and the total number of patients seen for any reason each week. The "percentage of visits for ILI" is the number of ILI patients divided by the total number of patients visit per week. Nevada's percentage of ILI visits for week 18 is 1.4% which is below the state baseline of 1.5%. Region 9 ILI percentage for week 18 is 1.8% which is below the region baseline 2.5%. Region 9 includes the following states/territory: Arizona, California, Guam, Hawaii, and Nevada. The national ILI percentage for week 18 is 1.6% which is below the national baseline 2.2%.

Figure 3

**Source of Data:** CDC: FluView Report and CDC: ILINet.
During week 18, 1.4% of visits to sentinel providers were due to ILI; this is higher than the 2015-2016 influenza season (0.6%). There were 10,769 patients seen by sentinel providers during week 18, of which 4,154 patients presented with ILI; week 18 of 2016, there were 98 patients seen with ILI (16,473 total patients seen).

**Figure 4**

Nevada Percentage of Visits for Influenza-like Illness, Weekly Summary
53 Week Comparison (2016-2017)

Source of Data: CDC: ILINet.

Influenza-like Illness is reported by age groups. During week 18, patients age 0-4 were the greatest number of patients seen with ILI, at 54 patients seen. The rate for week 18 is 5.2 per 100,000 population. The rate is calculated by the number of patients presented with ILI, divided by the state population, multiplied by 100,000. The estimated state population for 2017 is 2,935,490.

**Influenza Positive Surveillance (NBS and NETSS)**

Positive cases of influenza are reported to the state health authority for surveillance purposes. Table 2 and Figure 6 reflect all positive influenza cases reported to the state. Types of influenza testing include commercial rapid diagnostic test (rapid), viral culture, fluorescent antibody, enzyme immunoassay, RT-PCR (PCR), and Immunohistochemistry. The two most common test types in Nevada are Rapid and PCR tests. During week 18, there were 56 influenza cases reported to the state, 3 influenza A, 52 influenza B and 1 unknown subtyping.

Pneumonia and Influenza (P&I) Mortality Surveillance

The Pneumonia and Influenza (P&I) mortality percentage is all deaths, where Pneumonia or Influenza is listed as the underlying or contributing cause of death, divided by the total deaths in Nevada for each week. As of May 16th, there were 30 P&I deaths and 345 total deaths for week 18 in Nevada. The CDC's most up-to-date National and National Epidemic Threshold data was for week 16.

Figure 7

Technical Notes

- Data are subject to changes, additionally, there is a lag in reporting.
- Influenza surveillance procedures vary by jurisdiction.
- Influenza-like illness (ILI): a fever greater than or equal 100°F with cough and/or sore throat.
- Percent positive: The number of positive influenza laboratory tests divided by the total number of tests performed.
- Incidence rate is per 100,000 population as estimated by the state demographer.

This report contains information from national and state-level data sources. Influenza surveillance data is collected by a various systems, including:

- Influenza-like Illness Network (ILINet): a sentinel surveillance system in collaboration with the Centers for the Disease Control and Prevention (CDC) where outpatient providers report ILI information weekly.
- National Electronic Telecommunication System for Surveillance (NETSS): a system whereby data is transmits to CDC. Influenza data collected through NETSS does not provide influenza sub-typing information.
- National Electronic Disease Surveillance System (NEDSS): a system for collecting data and monitoring disease trends and outbreaks.
- NEDSS Based System (NBS): an implementation of the NEDSS standards. It provides a secure, accurate, and efficient means of collecting, transmitting, and analyzing public health data.
