\*YPLL represents the total number of probable lost years of life, which is calculated by summing the difference between a standard age (75 years), and the death age for each person in the population.

^YPLL rate: Total number of years of potential life lost per 100,000 population aged less than 75 years.

~The percent of persons under age 75 by total death by specific cause of death.

Population data was provided by the Nevada State Demographer in March 2012.
