To Nevada State Board of Health,

Forcing or coercing young healthy people to take a vaccine that has not yet been fully approved by the FDA, is unethical and unsafe. The long term effects of vaccinations and medications are sometimes not known until years later. The decision to receive a vaccination should be a personal decision. Each persons' health history should be private. Recent studies have shown that the efficacy of these vaccines were not known from the initial studies, they have shown to be decreasing in efficacy and now the pharmaceutical companies are suggesting booster shots every 8 months. Their initial studies have not had time to be completed, these are the first vaccines of this kind. The CDC keeps having to change their recommendations frequently to keep up with what they are learning. How can a vaccine that they are still learning about be made mandatory? Why aren't we studying more about natural immunity? Why aren't we trying to come up with more treatments? Please help to protect our youths health and their freedom. Help us to regain trust in our health community and government by doing what is right.

Thank you,  
Michell Schultz RN
